

Cross-ETF Relative Value Reversal

Relative ETF price-pressure evidence across liquid fund exposures.

Etf Passive Flow Price Discovery | Secondary research | 1d preferred horizon

Executive Summary

This note summarizes historical rank evidence for Cross-ETF Relative Value Reversal. Metrics are reported as research diagnostics under the source-run assumptions and should be read as evidence about ranking behavior, not as a live recommendation.

Preferred horizon	1d
Top-bottom spread	0.19%
Rank IC	0.070
Long-leg return	n/a
Average turnover	n/a

1. The preferred diagnostic horizon is 1d, where the recorded rank spread is 0.19%.
2. Spread evidence is strongest around the 1d horizon in the available comparison set.
3. Rank IC is positive in the reported research run at 0.070.

Data and Research Setup

UNIVERSE

Liquid ETF universe used by the passive-flow research runs.

INPUTS

Daily ETF close prices and related price-pressure proxy fields.

CADENCE

Short-horizon review aligned to available ETF observations.

COMPARISON BASIS

Comparisons use the same universe and source assumptions inside each run. The note omits current constituents, current tickers and live recommendations.

The source files were used for historical research extraction only. This note does not disclose current constituents, current ranks or position-level recommendations.

Signal Methodology

Without disclosing the exact functional, the construction proceeds along three conceptual steps.

1. **Signal measurement.** Measures a cross-sectional characteristic available at the research observation date.
2. **Cross-sectional ranking.** Ranks instruments so the strongest and weakest observations can be compared on the same assumptions.
3. **Horizon evaluation.** Evaluates whether the preferred horizon is supported by adjacent horizons or sample-split evidence.

The description is intentionally conceptual. Formula details, exact construction rules and implementation parameters are not disclosed.

Results and Horizon Context

Figure 1. Cumulative 1d top-minus-bottom rank-spread contribution. Long-horizon forward observations can overlap, so the series should be read as a ranking diagnostic, not as a standalone portfolio NAV.

Figure 2. Spread profile across the tested horizons available in the source validation summary.

Horizon	Rank spread	Rank IC	Long-leg return	Turnover
1d	0.19%	0.070	n/a	n/a
5d	0.17%	0.041	n/a	n/a
21d	0.18%	0.020	n/a	n/a
63d	0.12%	0.010	n/a	n/a

Stability and Robustness

Figure 3. Rank-IC evidence across the available horizon set. Where only one horizon is available, the chart should be read as a compact evidence marker.

The available horizon evidence is coherent enough for a research note. Positive-year fraction is 100.0% in the source run.

Positive-year fraction	100.0%
Universe size	1,085
Validation dates	2,748

Research Interpretation

ROLE IN RESEARCH LIBRARY

Cross-sectional research-library ranking component.

WHAT IT CAPTURES

Relative characteristic information under the source-run assumptions.

KNOWN LIMITATIONS

The note reports historical research diagnostics, not a standalone live strategy.

The evidence supports retaining the signal in the research library where it can be compared with related components under the same assumptions.

Historical research output. Not investment advice. Not a live recommendation.
