

ETF Short-Horizon Mean Reversion Rank

Cross-sectional option-volatility evidence under the available historical sample.

Etf Short Horizon Mean Reversion | Secondary research | 10d preferred horizon

Executive Summary

This note summarizes historical rank evidence for ETF Short-Horizon Mean Reversion Rank. Metrics are reported as research diagnostics under the source-run assumptions and should be read as evidence about ranking behavior, not as a live recommendation.

Preferred horizon	10d
Top-bottom spread	0.77%
Rank IC	n/a
Long-leg return	n/a
Average turnover	n/a

1. The preferred diagnostic horizon is 10d, where the recorded rank spread is 0.77%.
2. The signal is best read as a research-library ranking component, not as a standalone product.

Data and Research Setup

UNIVERSE

Equity or ETF option-volatility observations where historical EOD option data are available.

INPUTS

Daily close prices, realized volatility proxies and available implied-volatility fields.

CADENCE

Short to medium-horizon review constrained by the available option-history sample.

COMPARISON BASIS

Comparisons use the same universe and source assumptions inside each run. The note omits current constituents, current tickers and live recommendations.

The source files were used for historical research extraction only. This note does not disclose current constituents, current ranks or position-level recommendations.

Signal Methodology

Without disclosing the exact functional, the construction proceeds along three conceptual steps.

1. **Signal measurement.** Measures relative extension or residual dislocation in the source universe.
2. **Cross-sectional ranking.** Ranks observations by the degree of overextension after applying the source-run controls.
3. **Horizon evaluation.** Evaluates whether subsequent return differences are directionally consistent across horizons.

The description is intentionally conceptual. Formula details, exact construction rules and implementation parameters are not disclosed.

Results and Horizon Context

Figure 1. Top-minus-bottom spread by tested horizon from the available validation summary. The chart is a diagnostic comparison, not a standalone portfolio NAV.

Horizon	Rank spread	Rank IC	Long-leg return	Turnover
10d	0.77%	n/a	n/a	n/a

Stability and Robustness

Figure 3. Rank-IC evidence across the available horizon set. Where only one horizon is available, the chart should be read as a compact evidence marker.

The available evidence is summary-level, so interpretation should stay narrow. Positive-year fraction is 81.8% in the source run.

Positive-year fraction	81.8%
Universe size	n/a
Validation dates	n/a

Research Interpretation

ROLE IN RESEARCH LIBRARY

Machine-learning ranking component inside the research library.

WHAT IT CAPTURES

Nonlinear interaction evidence between the source feature set and subsequent cross-sectional returns.

KNOWN LIMITATIONS

Model evidence depends on the training window, feature availability and replay assumptions. It is not a live trading specification.

The evidence supports retaining the signal in the research library where it can be compared with related components under the same assumptions.

Historical research output. Not investment advice. Not a live recommendation.
